QUALITY CONTROL

Tensile strength

Measuring how much bending and shaping our raw materials can withstand before braking or being deformed

Rheometric tests

Measuring the response of the rubber to applied forces before, during and after the curing of the rubber

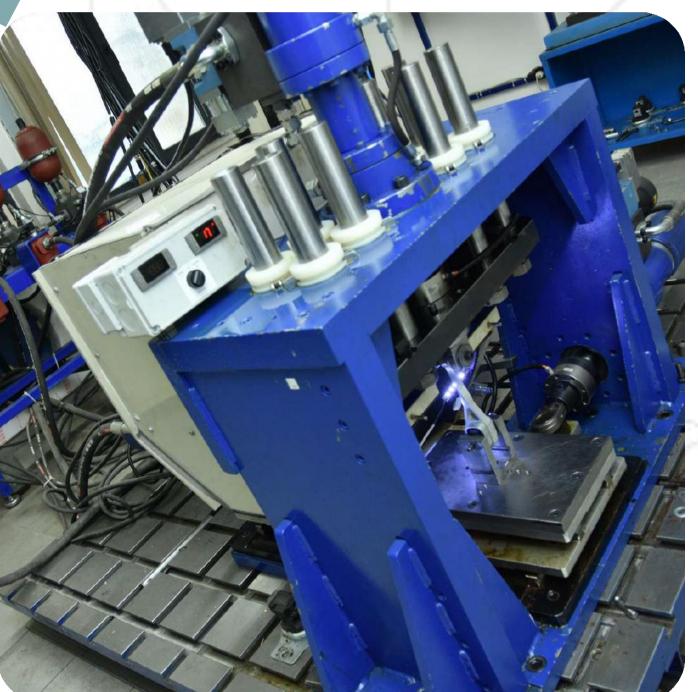

Fatigue tests

Putting the car part through a round of cycles that simulate the road application of the part to specify the capacity of the part and the load it can withstand through a certain number of cycles

Load & force test

Measurement of the effect of force applied to rubber parts by applying force to rubber

Coating & thickness test

Ensuring the quality of the coating systems chosen to protect out metal parts

Crankshaft pulley fatigue test

Crankshaft pulleys have a basic role in the performance of different systems of the car. We put our crankshaft pulleys through a the fatigue test applying measured force and a specified number of cycles to assess the performance of the crankshaft pulley

QUALITY CONTROL

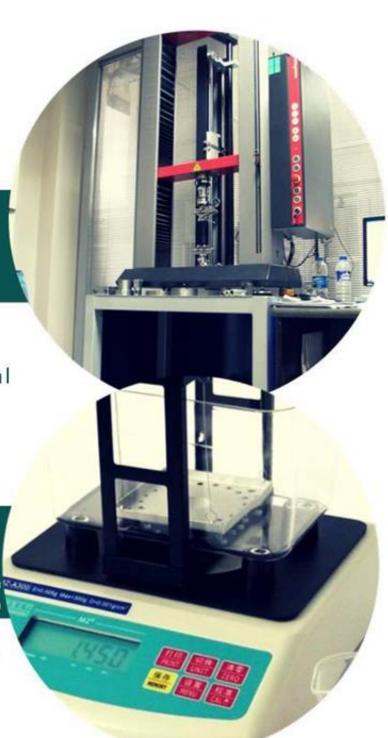

Elongation

Elasticity and hardness measurement of rubber and metal material

Density measurment

It is the test in which rubber density is measured.

AFFRI SYSTEM

Compression Set

Applying force on rubber under a certain degree to measure the deformation of the material after a specified amount of time

Hardness test

The hardness of metal products and material is measured by applying permanent force on the part or the material to assure the necessary quality level for the market
